

Dla małych wartości, można przybliżyć ~ Brook Taylor

$$\frac{1}{\sqrt{1-\beta^2}} \approx 1 + \frac{1}{2}\beta^2 + O(\beta^4)$$

 $\gamma m_V \approx \left(1 + \frac{1}{2} \beta^2\right) m_V \approx m_V = p$

wyglada jak klasyczny pęd

 $\gamma mc \approx (1 + \frac{1}{2}\beta^2) mc$

$$= mc + \frac{1}{2c}mv^2 \stackrel{?}{=} \frac{E}{c}$$
